

SINTEF Building and Infrastructure confirms that

Corotop CLASSIC 130, RED STRONG 180 and tapes

has been found to be fit for use in Norway and to meet the provisions regarding product documentation given in the regulation relating to the marketing of products for construction works (DOK) and regulations on technical requirements for building works (TEK), with the properties, fields of application and conditions for use as stated in this document

1. Holder of the approval

GLOBAU Sp. Z o.o, CB SA
 Ul. Ozimska 2a
 46-053 Chrzęstowice
 Poland

2. Product description

Corotop CLASSIC 130 and Corotop RED STRONG 180 combined roofing underlay and wind barrier is a three-layer membranes of thermally bonded non-woven polypropylene fabric, sandwiching a microporous film, to achieve a vapour open membrane. Measures and tolerances are given in table 1.

Corotop CLASSIC 130 combined roofing underlay and wind barrier is dark grey and labelled with its name, and information in black letters regarding mounting.

Corotop RED STRONG 180 combined roofing underlay and wind barrier is red and labelled with its name, and information in black letters regarding mounting.

Additional products which can be used are the tapes Corotop Band and Corotop Mix. The tapes are single sided and double sided with acrylic adhesive. Further information about tape products are given in table 3.

Table 1
 Measures and tolerances for Corotop CLASSIC 130 and Corotop RED STRONG 180

Property	Corotop CLASSIC	Corotop RED STRONG	Unit	Tolerance
Area weight	130	180	kg/m ²	± 10%
Width	1,5 – 2,8 – 3,0		m	+1,5%/-0,5%
Length / Roll	50	50	m	+5%/-0%

Measured according EN 1848-2 and EN 1849-2.

Fig. 1

Corotop CLASSIC 130 or RED STRONG 180 combined roof underlay and wind barriers mounted along the rafters

3. Fields of application

Corotop CLASSIC 130 and Corotop RED STRONG 180 can be used either as wind barriers in thermal insulated, wall- and roof constructions or as combined roofing underlays and wind barriers in thermal insulated pitched wooden roofs with ventilated, discontinuous roofing with external drainage, see fig. 1. and 2.

Used as combined roofing underlay and wind barrier are these membranes particularly suitable for roofs with continuous thermal insulation from eaves to ridge. Membranes can may also be applied in pitched wooden roofs without insulation partly or in general.

Corotop CLASSIC 130 and Corotop RED STRONG 180 combined roof underlay and wind barrier can be used on roofs in buildings in hazard class 1-6 in fire class 1,2 and 3.

Table 2: Material- and construction properties for Corotop CLASSIC 130 and Corotop RED STRONG 180 combined roofing underlay and wind barrier

Property	Method	Corotop CLASSIC 130		Corotop RED STRONG 180		Unit
		DoP ¹⁾	Control limit ²⁾	DoP ¹⁾	Control limit ²⁾	
Dimensional stability, -Longitudinal -Transversal	EN 1107-2:2001	- -	< 2 < 2	- -	< 2 < 2	%

¹⁾ Declared value given in the manufacturers DoP (Declaration of performance)

²⁾ Control limit shows values the product should satisfy during internal factory production control and audit testing

³⁾ Result from type testing

Table 3

Product specification for associated installation components for Corotop CLASSIC 130 and Corotop RED STRONG 180 combined roofing underlay

Component	Materialtype	Description	Measures
Corotop Band	single sided PP spun bonded tape with an acrylic dispersion as adhesive	Reparation of ruptures, holes or cuts in Corotop products.	Width: 50 mm / 75 mm / 100 mm Length: 25 m
Corotop Mix	double sided acrylic dispersion tape with a reinforcement of polyester fibres	Overlap jointing of Corotop products	Width: 20 mm / 40 mm Length: 25 m

Corotop CLASSIC 130 and Corotop RED STRONG 180 can be used as wind barriers on walls in hazard class 1-6 in fire class 1 in buildings up to three floors if each dwelling unit has direct access to the ground level (not via stairs or stair cases). For other use, a fire safety analysis has to be performed.

Corotop Band tape is designed to be used to repair ruptures, holes or cuts in Corotop CLASSIC 130 and Corotop RED STRONG 180.

Corotop Mix tape is designed to be used for joints of Corotop CLASSIC 130 and Corotop RED STRONG 180.

4. Properties

Material properties

Material characteristics for Corotop CLASSIC 130 and Corotop RED STRONG 180 are shown in Table 2.

Safety in case of fire

Corotop CLASSIC 130 and Corotop RED STRONG 180 have a reaction to fire class E according to EN 13501-1.

Fig. 2 Principle of Corotop CLASSIC 130 or RED STRONG 180 as combined roofing underlay and wind barrier

Durability

The durability for Corotop CLASSIC 130 and Corotop RED STRONG 180 has been tested before and after exposure to artificial ageing according EN 13859-2 and are considered to have satisfactory durability during a construction period as long the products are not exposed to direct UV radiation in the finished construction.

Corotop Band and Corotop Mix have been tested before and after artificially ageing. Tapes are considered to have satisfying properties of adhesion against Corotop CLASSIC 130 and Corotop RED STRONG 180 according SINTEF.

Resistance against tread through

Resistance against tread through is not evaluated for Corotop CLASSIC 130 and Corotop RED STRONG 180.

5. Environmental aspects

Substances hazardous to health and environment

The product contains no hazardous substances with priority in quantities that pose any increased risk for human health and environment. Chemicals with priority include CMR, PBT or vPvB substances.

Waste treatment/recycling

The product shall be sorted as residual waste. The product shall be delivered to an authorized waste treatment plant for energy recovery.

Environmental declaration

No environmental declaration (EPD) has been worked out for the product.

6. Special conditions for use and installation

General

Corotop CLASSIC 130 and Corotop RED STRONG 180 should be installed in a way that provides both an airtight and a watertight layer on walls or roofs.

Corotop CLASSIC 130 and Corotop RED STRONG 180 used as wind barrier shall follow the principles in the following SINTEF Building Design Sheets:

- 523.255 Bindingsverk av tre. Varmeisolering og tetting
- 525.101 Isolerte skrå tretak med lufting mellom vindspærre og undertak.

Corotop CLASSIC 130 and Corotop RED STRONG 180 used as combined roofing underlay and wind barrier shall also follow the principles in SINTEF Building Design Sheet:

- 525.102 Isolerte skrå tretak med kombinert undertak og vindspærre.

Design considerations

Membranes used as combined roofing underlay and wind barrier the minimum pitch of the roof should be in minimum 10°.

Corotop CLASSIC 130 and Corotop RED STRONG 180 shall be installed parallel to the rafters and studs and clamped continuously as shown in fig. 1 and 2.

Fig. 3 Example of connection between combined roofing underlay and wind barrier in the roof in a construction without thorough rafters. The connection between combined roof underlay and wind barrier should here be sealed at the top of the nogging beam.

Fig. 4 Example of assembling a chimney bushing by using the combined roofing underlay and wind barrier and additional tapes.

The wall cladding as well as the roofing should be finished as soon as possible after the product has been installed, to prevent that the wind barrier is freely exposed to weather and/or UV radiation for a longer time period. Thermal insulation, vapour barrier and the interior lining shall not be installed before the exterior cladding or roofing has been finished and the underlay is checked to be mounted properly.

Because of minimizing the pressure at the overlaps due to shrinkage of the studs or the rafters, the moisture content of the timber should not exceed 20 % when installed.

Installation

All the joints shall have minimum 50 mm overlap and all the joints, edges and connections to other components shall be clamped against the studs, sills, rafters etc. with battens. During installation, the products should be installed tightly fixed on rafters and walls to avoid folds in the membranes.

Counter battens and ventilation space

Spaces between combined roofing underlay and roofing have to be ventilated. Recommended heights for counter battens related to different lengths of rafters are mentioned in table 4.

Table 4. Recommended height of counter battens (mm), depending on roof pitch and roof length.

Roof pitch	Roof length (m) ¹⁾	
	7.5	10
10 – 30 °	36	36 + 36
31 – 40 °	30	36
≥ 41 °	23	36

¹⁾ Measured along the pitched rafter from eave to ridge

For bigger sized roofs should distances of roofing underlay and battens be improved according to SINTEF Building Design Sheet:

- 525.102 *Isolerte skrå tretak med kombinert undertak og vindsperre.*

Counter battens shall be fixed with screws in max c/c 300 mm distance. It is recommended to use screws which have no thread in the length of the counter battens height.

Combination with wooden board sheeting

Corotop CLASSIC 130 and Corotop RED STRONG 180 may be applied as roofing underlay in combination with wooden board sheeting provided a total water vapour resistance of maximum s_{d} -value = 0,5 m.

If using wooden sheeting made of plywood or OSB-boards, the water vapour resistance should be documented.

Corotop Combined roof underlay and wind barrier can be assembled directly to wooden board sheeting made of spruce or pine in old roofs which are reconstructed and insulated.

Connections to other components and structures

Corotop CLASSIC 130 and Corotop RED STRONG 180 shall be installed with airtight connections to exterior walls wind barrier. In addition shall also all other details be airtight performed, like ridges or valleys. Penetrations through roof (chimney, roof windows, pipes etc.), have also to be performed both water- and airtight. Examples for construction details are shown in SINTEF Building Design Sheet:

- 525.102. *Isolerte skrå tretak med kombinert undertak og vindsperre.*

Transport and storage

Corotop CLASSIC 130 and Corotop RED STRONG 180 shall be stored under dry conditions, where rolls are placed on pallets and wrapped.

7. Factory production control

The product is produced of GLOBAU Sp. Z o.o, Kolejowa 1, 46-040 Ozimek, Poland.

The holder of the approval is responsible for the factory production control in order to ensure that the product is produced in accordance with the preconditions applying to this approval.

The manufacturing of the product is subject to continuous surveillance of the factory production control in accordance with the contract regarding SINTEF Technical Approval.

8. Basis for the approval

The approval is based on properties documented in the following reports:

- SINTEF report 102010396-4, dated 18.11.2015, Air- and rain tightness / material properties
- SINTEF report 102009556-4-1, dated 02.09.2015, Type testing for Corotop Band and Corotop Mix
- SINTEF report 102009556-4-2, dated 08.04.2016, Driving rain testing
- SINTEF report 102009556-4-3, dated 23.06.2017, Air tightness testing
- TSUS, Test report no. 90-16-0162, dated 2016-09-09, Material properties for Corotop LIGHT 100
- TSUS, Test report no. 90-16-0163, 2016-09-09 (material properties - Classic)
- TSUS, Test report no. 90-16-0161, 2016-09-08 (material properties – Red Strong)

9. Marking

Each roll of Corotop CLASSIC 130 and Corotop RED STRONG 180 are marked with information about product name, name of the manufacturer and date of manufacturing. The product is CE marked in accordance with EN 13859-2. The approval mark for SINTEF Technical Approval No. 20648 may also be used.

Approval mark

10. Liability

The holder/manufacturer has sole product responsibility according existing law. Claims resulting from the use of the product cannot be brought against SINTEF beyond the provisions of Norwegian Standard NS 8402

for SINTEF Building and Infrastructure

A handwritten signature in blue ink that reads "Marius Kvalvik".
